There Are No Two Alike

There is a common adage that, “no two snowflakes are alike.” Scientists actually have some evidence to suggest that this might in fact be true.

One million billion kilograms of snow falls each year. Each snow flake is shaped based on temperature, wind, and humidity. The possibilities that these three variables have the same exact conditions are near impossible.

Do you have anything that you think is one of a kind? Describe it. Do you think anyone else in the world has one? Tell us about that person.
